

# The Amazing Tile & Glass Cutter

Invented in Great Britain in 1971

It is VERY IMPORTANT to oil the wheel before using the tool. Oil every other cut for best results for tile and every cut on glass, this will not only give a cleaner cut it will also increase the wheel life.

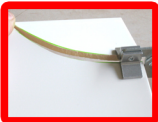

Score the tile very firmly one edge to another, for Floor Tile use 2 hands and lean over to get the extra pressure, the harder the tile the more pressure needed to score. DO NOT hold the tool by the red handles when scoring you will not be able score hard enough like that.

Once scored position the breaker dead center over the score line and as far into the jaws as is possible then squeeze the handles from the end of the red grips - this will give more leverage GENTLY increasing the pressure until the tile breaks cleanly - Guys do not over squeeze!

Following a line for shapes is possible by watching at the back of the wheel - always pull towards you and not away. About a quarter of a circle is possible even wiggly lines to a degree, no sharp angles though as you cant bend around corners - you can use the Rodsaw for square & angle cuts.

When breaking curves dead center the breaker over the score line but angle it toward the cut so the bar will be pushing up right underneath the score line, place into the jaws as far as possible. Hold the piece that you want so as not to drop or chip it and again don't over squeeze!

Glass, mirror and stained glass should be scored firmly with the wheel oiled, you need to hear it score and see the line if not apply pressure until you do. Lift the glass slightly and squeeze handles gently and slowly until it starts to run along the score line all the way to the end.
